

# Cloud Platform Engineer (m/f/d) - Tunis

We are looking for a highly motivated Cloud Platform Engineer to join our team in Tunis. You will design business-critical IT systems - your time is too valuable for less. In enterprise projects you are involved from start to finish. You will do the step into the cloud together with our team of experts. You give yourself and your team a clear view.

As a Cloud Platform Engineer, you're able to bring worlds together: You see yourself as a bridge of communication between development and operations and unite both views in the team. In your mind, Cloud and DevOps belong together, like development to the agile process.

- Your knowledge of one of the big cloud providers such as AWS, Google or Azure may already have been certified.
- You are enthusiastic about automation: Infrastructure-as-code tools such as Ansible, Kubernetes, Puppet or Terraform can be used and evaluated correctly.
- With your solid programming skills you can move confidently in distributed systems - or already in serverless computing?
- Which services make sense for customers in the cloud can be assessed in terms of costs, maintenance and effort.
- You contribute your experience with cloud networks and security measures to our team.
- You participate in technical communities and share your knowledge with the Team.
- You have preferably good English skills and the willingness to learn German

Florian, 38.
